

## WINNER

### AAM & WA DEPARTMENT OF HEALTH Maternity Services Viewer

#### What was the problem?

The Statewide Obstetric Support Unit identified an issue for rural mothers and/or newborns 'falling through the cracks' once they were discharged from tertiary or secondary care institutions, often resulting in 'near misses' and/or poor health outcomes. There was a clearly identified knowledge deficit when discharging a patient pertaining to the awareness as to the available health services at/or close to the mothers' discharge destination.

#### What were the key outcomes?

Health workers now have easily accessible information about available services for rural mothers in Western Australia, improving health outcomes.

#### How did you address it?

The Maternity Services Viewer (MSV) is simple, uncluttered and intuitive mapping interface, which caters to health sector staff from a range of technical backgrounds and capabilities. Tools and workflows implemented within the MSV provide clinicians multiple methods of obtaining Maternity Services related information, quickly and easily. Users follow simple guided interactions, which drive sophisticated spatial and attribute queries, as well as system integrations, to provide requisite information.
